Integrated Backup and Exchange Email Archiving Service

Provides a Regulatory Compliant Email Archiving Solution Integrated with Safe and Secure Offsite Backup to Protect Your Valuable Information
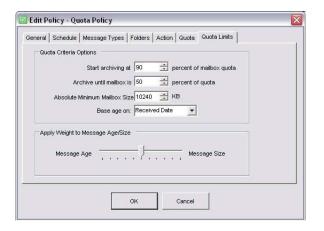

AZXnetworks **Mail Archive** delivers an Exchange email archiving solution that easily integrates with your current off-site backup solution to deliver regulatory compliance, improved Exchange performance, secure offsite storage, and message level restoration. Integration of the email archiving and backup functionality needed for your Exchange server will guarantee that your valuable information is protected and available at all times.

What does *AZXnetworks* Mail Archive do?

The two main forces driving the rapid growth of the email archiving industry are Exchange performance issues and the advent of email regulatory compliance requirements. Our solution provides industry leading capability and flexibility in resolving both of these important issues at a very cost effective price.

How Does *AZXnetworks* Mail Archive Work?

Our solution is an administrator driven product designed to selectively move or copy messages from Exchange mailboxes, PST files, and public folders to any storage device visible to the application via the network. Management of this process is executed through an application interface that can be used to setup the schedule, search the indexed archives, define archive policies and view reports. The *AZXnetworks-eVault* **Mail Archive** solution assists companies with storage and compliance requirements while offering a flexible archiving architecture that does not require a SQL database or proprietary hardware.

The unmatched configuration flexibility allows the Exchange Administrator to manage resources, increase performance, exceed compliance requirements and securely backup the valuable information stored in Exchange all for a very competitive price.

How Does Archive Integrate with *AZXnetworks*?

The *AZXnetworks-eVault* **Mail Archive** software is installed on the end-users network and moves the archived information to another location on the network. You simply include the archived information in your list of files that is being backed up and the archived data is stored safely in a secure offsite data center. Archived data can be restored at to the message level from the local archive or restored completely from the data center as required.

Who Needs Email Archiving?

Every company with an Exchange server will need an archiving product sooner or later because Exchange servers are just not as efficient as they should be and because email storage requirements are growing faster than ever. Having a fully featured email archiving product integrated with a world-class backup solution allows you to protect your valuable data while improving the performance of your Exchange server.

What *AZXnetworks* Mail Archive Delivers...

Simple

- **Easy 15 minute installation** – The software is easily installed on your network and quickly configured for the mailboxes that are to be archived.

- **No SQL or backend database Required** – Unlike most of the competition, the *AZXnetworks-eVault* **Mail Archive** product does not require a separate database to be installed and maintained. Everything you need is provided by our software.

- **No client installation required** – No client software is needed for each mailbox or for each workstation. Our solution utilizes Outlook as the interface to the archived data so there is no additional software to learn or manage.

- **No installation required on the Exchange server** – Most Exchange servers are already pushing the limits of acceptable performance so the ability to install the archiving software somewhere other than the Exchange server is a huge performance advantage. The software can be installed directly onto the Exchange server if desired (e.g., SBS servers, etc.).

- **No proprietary hardware** – *AZXnetworks-eVault* **Mail Archive** does not require any special or expensive additional hardware, it just uses the resources you have available.

- **No Outlook plug-in** – No need to install a cumbersome Outlook plug-in to confuse end-users, slow down performance, or increase management issues.

- **Small resource footprint on Exchange server** – The resource footprint on the Exchange server is very small and is limited to the email archiving product communication with the Exchange server.

Flexible

- **Enforce retention policies at the user level** – Industry leading flexibility in how email archiving is configured. *AZXnetworks-eVault* **Mail Archive** allows you to determine which users will have their email archived, which archiving policy to use and how far back to go when setting up the initial policies. Archiving criteria includes sender, date, quota, age, size and much more.

- **Archive all Exchange data stores including sticky notes etc**. – Any of the additional Exchange information can be included as part of the archiving configuration.

- **All content is stored in native format** – All of the archived information is stored in the native Exchange format to maximize performance and the reduce complexity of the system. No need to purchase, install, configure, or maintain an additional SQL Server or proprietary database.

- **Journaling allows all email to be archived** – Unlike most competitors that require journaling of the Exchange Server email flow, journaling is an option. Having the option to utilize journaling on all users or only archiving selected mailboxes provides the flexibility you need to meet all of your end-user requirements.

- **Advanced flexible scheduling available** – Protect the performance of your network infrastructure by scheduling when the archiving process takes place. You control the archiving product instead of the archiving product controlling your environment.
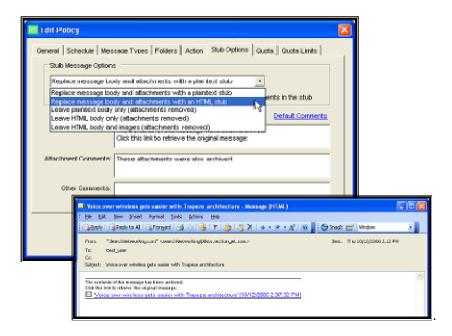

AZXnetworks

*V*oice, Data, Phone Systems, *O*perating Systems, *I*nternet, *C*abling, *E*-Business, *S*ecurity and more...

- **Supports or eliminates network stored PST files** – For companies that store all of their Outlook PST files on their network, the *AZXnetworks-eVault* **Mail Archive** solution provides an option to support or eliminate these PST files based on your requirements and not on limitations imposed by your email archiving solution.

- **Can archive older data in addition to all new data** – Unlike most of the competition which only archives email from the day the archiving product is installed and onwards, the *AZXnetworks-eVault* **Mail Archive** solution will allow you to apply the archiving policies to all older files giving you immediate results in improved performance and reduced file sizes.

- **Integrate with Active Directory groups** – Delivers the flexibility needed to effectively manage larger systems by providing support for Active Directory Groups.

Competitive

- **Cost effectiveness** – Utilizing an email archiving solution as a monthly service reduces the out-of-pocket expense required to purchase an in-house archiving product and the on-going maintenance required to keep it running.   You can easily implement archiving for just dollars per month per mailbox, all while receiving complete support and the latest software.

Pricing for the *AZXnetworks* Mail Archive Service

The *AZXnetworks-eVault* **Mail Archive** service is delivered as a monthly service and billed based on the number of mailboxes in use by your organization. All mailboxes **do not have** to be archived so the billing is based only on the mailboxes actively being archived.

Monthly Fees:

$9.99 per month for the *AZXnetworks-eVault* **Mail Archive** Service plus
$4.99 per month for each backed up mailbox.
